

### Scenario:

You are a student at the University of South Carolina living on campus. One night you find yourself extremely hungry and decide to order two beef tacos from Twisted Taco at the Russell House University Union for dinner. However, with the pending threat of COVID-19, you don't want to wait in line for longer than seven minutes and would rather order grubhub instead. You would prefer to check the line lengths and wait times at Russell House before entering.

### Task 1:

Check to see if Twisted Taco has beef tacos available for order.

### Task 2:

Check the length of the line at Twisted Taco.

### Task 3:

Bypass the line and order two beef tacos via the app.

### Notes:

#### 3 changes:

- Need to change the Grubhub button to "order online" to accommodate for anyone who may not know what Grubhub is
- Instead of having different screens for upstairs and downstairs restaurants, have one screen for both with only one button on first page of app
- Include a way for the user to give instructions for their order. For example, if ordering a bagel from Panera, they could ask for it sliced but not toasted.

#### 3 things to keep the same:

- Keep an option for someone to reserve a spot in line for ordering in person
- Keep a page to show the user what a specific restaurant has in stock tonight
- Keep a page to show the wait time to order in person. This shows how long the line is at a specific restaurant.
